

4 Seats x 10 Backs

PLANET CHAIRS

“What if we create a chair with different backrests that can be combined with each other?”

Planet chairs is a new collection of chairs based on two very important pillars. The first is the design and the large number of options it offers, and the second is the ergonomic solution it provides, perhaps the most comfortable chair we have ever seen.

If with Mili&Lalo and Ginger&Fred we learned to give our living rooms a different touch by using a different fabric on each chair, this time we thought: what if we create a chair with different backrests that can be combined with each other?

This is how the Planet Chairs collection was born, 4 types of seats available with metal rod bases or metal legs, and 10 different backrest designs that offer us infinite combinations.

Maybe you like the round backrest and prefer having your chairs all the same, and you can make them all in any of our fabrics (you have more than a thousand options), but you can also do as with Mili&Lalo, choose a fabric for each one of the chairs...

You can do the same thing with any of the other 9 backrests, but we can also expand the possibilities: what if we need 6 chairs and we choose 6 different backrests? The result leaves no one indifferent, you may not like it or you may fall in love with it. Now you can start playing, making combinations, there are lots of possibilities.

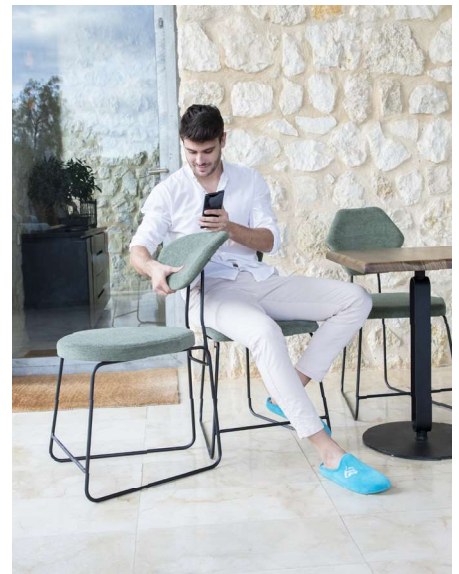

Here we show you some combination options, but the limit is set by you.

IMPORTANT FEATURES:

1. Metal frame (metal rod structure / metal legs)
2. 10 different back designs
3. 4 different seats
4. Different backrests combinable with each other
5. Ergonomic comfort during lunch/dinner time
6. Slightly reclined position
7. System equipped with an articulation in the backrest
8. Backrest with 30° inclination
9. Horizontal crossbar on the front legs
10. Stool version in 65 and 75cm height
11. Interchangeable seat system without screws
12. Seats with N.E.A. webbing

Now you can have comfortable chairs like you could never have imagined, and with a special touch that makes them different from everything else.

We present an **important innovation**, hidden behind these chairs' backs, **that provides an amazing comfort not known so far**. We explain it following these lines.

One of the fundamental functions of using chairs is to sit down to have lunch or dinner. Well, there are many chair options on the market, but really, there are hardly any chairs that offer good comfort for this use. The reason is that to perform the act of eating, in general, you must lean forward a little, while most chair backrests have a backward tilt. Therefore, when we sit down to eat we can hardly support our back ergonomically on the backrest of any chair, usually only on the lower part.

There are some chairs on the market that have a vertical backrest in order to provide comfort when carrying out actions that require a more upright position, but when we want to rest a little, the backrest becomes uncomfortable, it presses our back.

We have analysed this problem with the Hospitality world in mind, but also thinking in the Home sector, and finally **we have developed a chair that offers perfect ergonomic comfort while we are eating, supporting the back perfectly, but also allows us to achieve a slightly reclined position for the table talk** without endangering the integrity of the user or the construction of the chair.

To achieve this goal, we have designed **a backrest with a slightly curved shape that holds our back in a natural and ergonomic way**.

In addition, we have developed an innovation that consists of a **system equipped with a joint in the backrest** to allow the backrest to rotate with the user's movement and adapt to the position of the back.

Ergonomic Comfort

PLANET CHAIRS

Thus, when the user sits completely upright, the backrest obtains a perfectly straight position that fully supports the user's back. And when we prefer a more relaxed position, (drinking coffee or after a meal), just by moving the sitting position forward a few centimetres, the backrest accompanies our back until we achieve an inclination close to 30 degrees, thanks to its curved shape and the rotation with retention. We have already requested a patent for this invention.

Another fundamental ergonomic aspect is the **horizontal crossbar on the front legs** in the metal rod base version, which provides **great comfort for resting the feet**.

We also offer the **stool version of 65 or 75 cm height**. You should try it; it will be difficult to find a more comfortable stool.

We should also remember that there are **4 different seats**, which are **fastened with a screwless system that allows us to exchange them easily**. This system makes it easy to show customers any backrest with the different types of seats.

Another important functionality is the possibility of turning the back of a chair to be able to use it as a tray to leave a book when reading or for using the mobile phone or tablet.

It is important to emphasise that the **seats** have the same construction as the sofas and the Mili&Lalo chairs, they **include a webbing suspension with N.E.A.**, which compared to the basic wood seat system that most chairs on the market carry, is something that really makes a difference.

“An innovation that consists of a system that allows the backrest to rotate with the user's movement and adapt to the position of the user's back”

Wooden chair

MARS

Mars is an elegant and very comfortable chair design, perfect for any living room or dining room. It is inspired by the Planet Chairs collection, but in this case, the structure is made of beech wood, which gives it a more conventional style, but original at the same time.

Just as Mili&Lalo, Ginger&Fred, and now also the Planet Chairs, the Mars model allows us to play with different fabrics and colour combinations.

Both plain and patterned fabrics look spectacular on this lightweight chair; we can create sober combinations, with plain and more neutral colours, as well as others with a lot of colours or using prints. For the most daring ones, each chair can even be made with a different pattern.

The construction of the seat is similar to that of the sofas and the rest of the chairs in our catalogue, with N.E.A. webbing suspension, which provides greater comfort.

“Chair inspired by the Planet Chairs collection, but in this case, the structure is made of beech wood”
